LUBRICATING

HEAD DEMAGNETIZING

Refer to "General Servicing Information" on page 4.

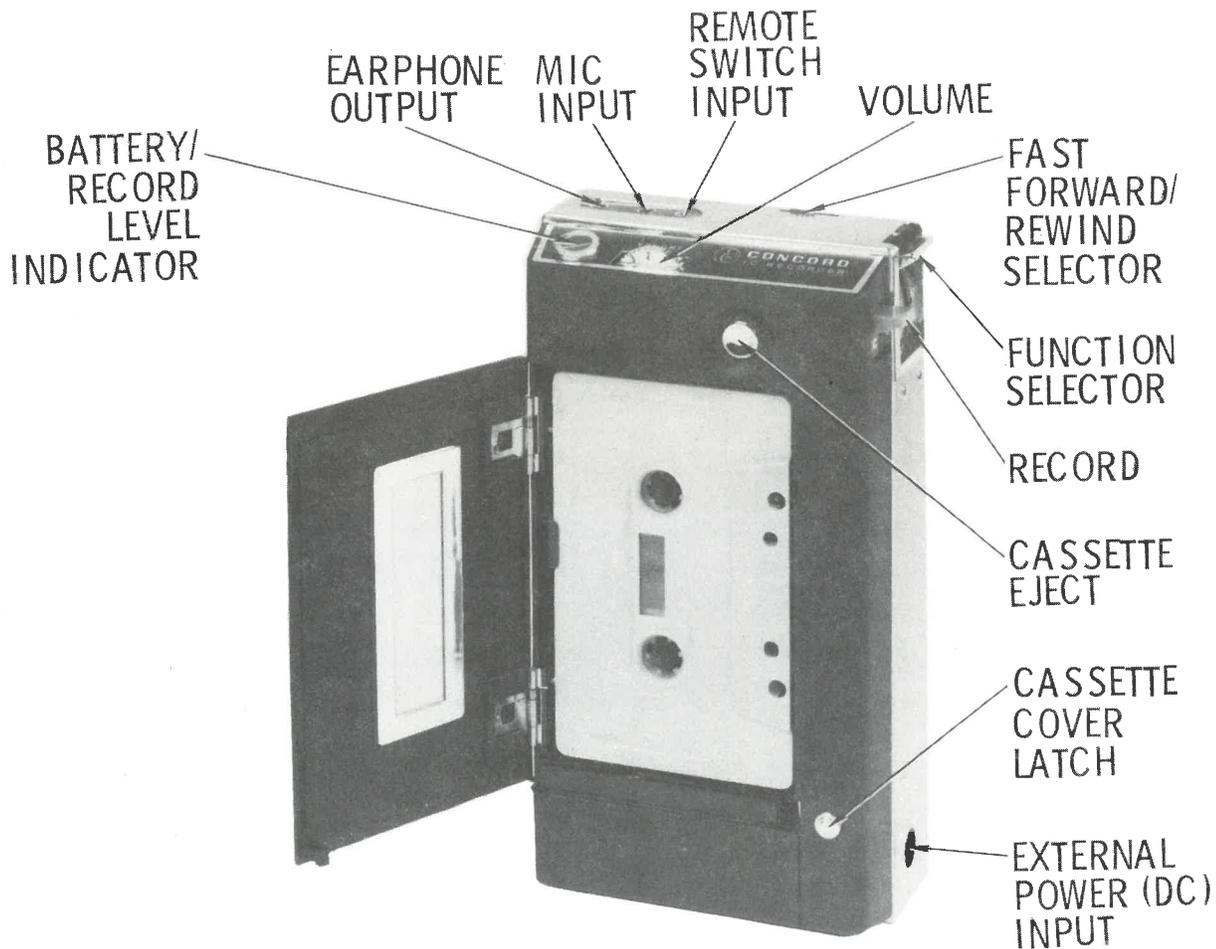

Concord Model F-101

This unit is a two-track monaural recorder having a speed of 1-7/8 ips. Automatic recording level is provided.

Jacks are provided for microphone, earphone, external power, and remote operation.

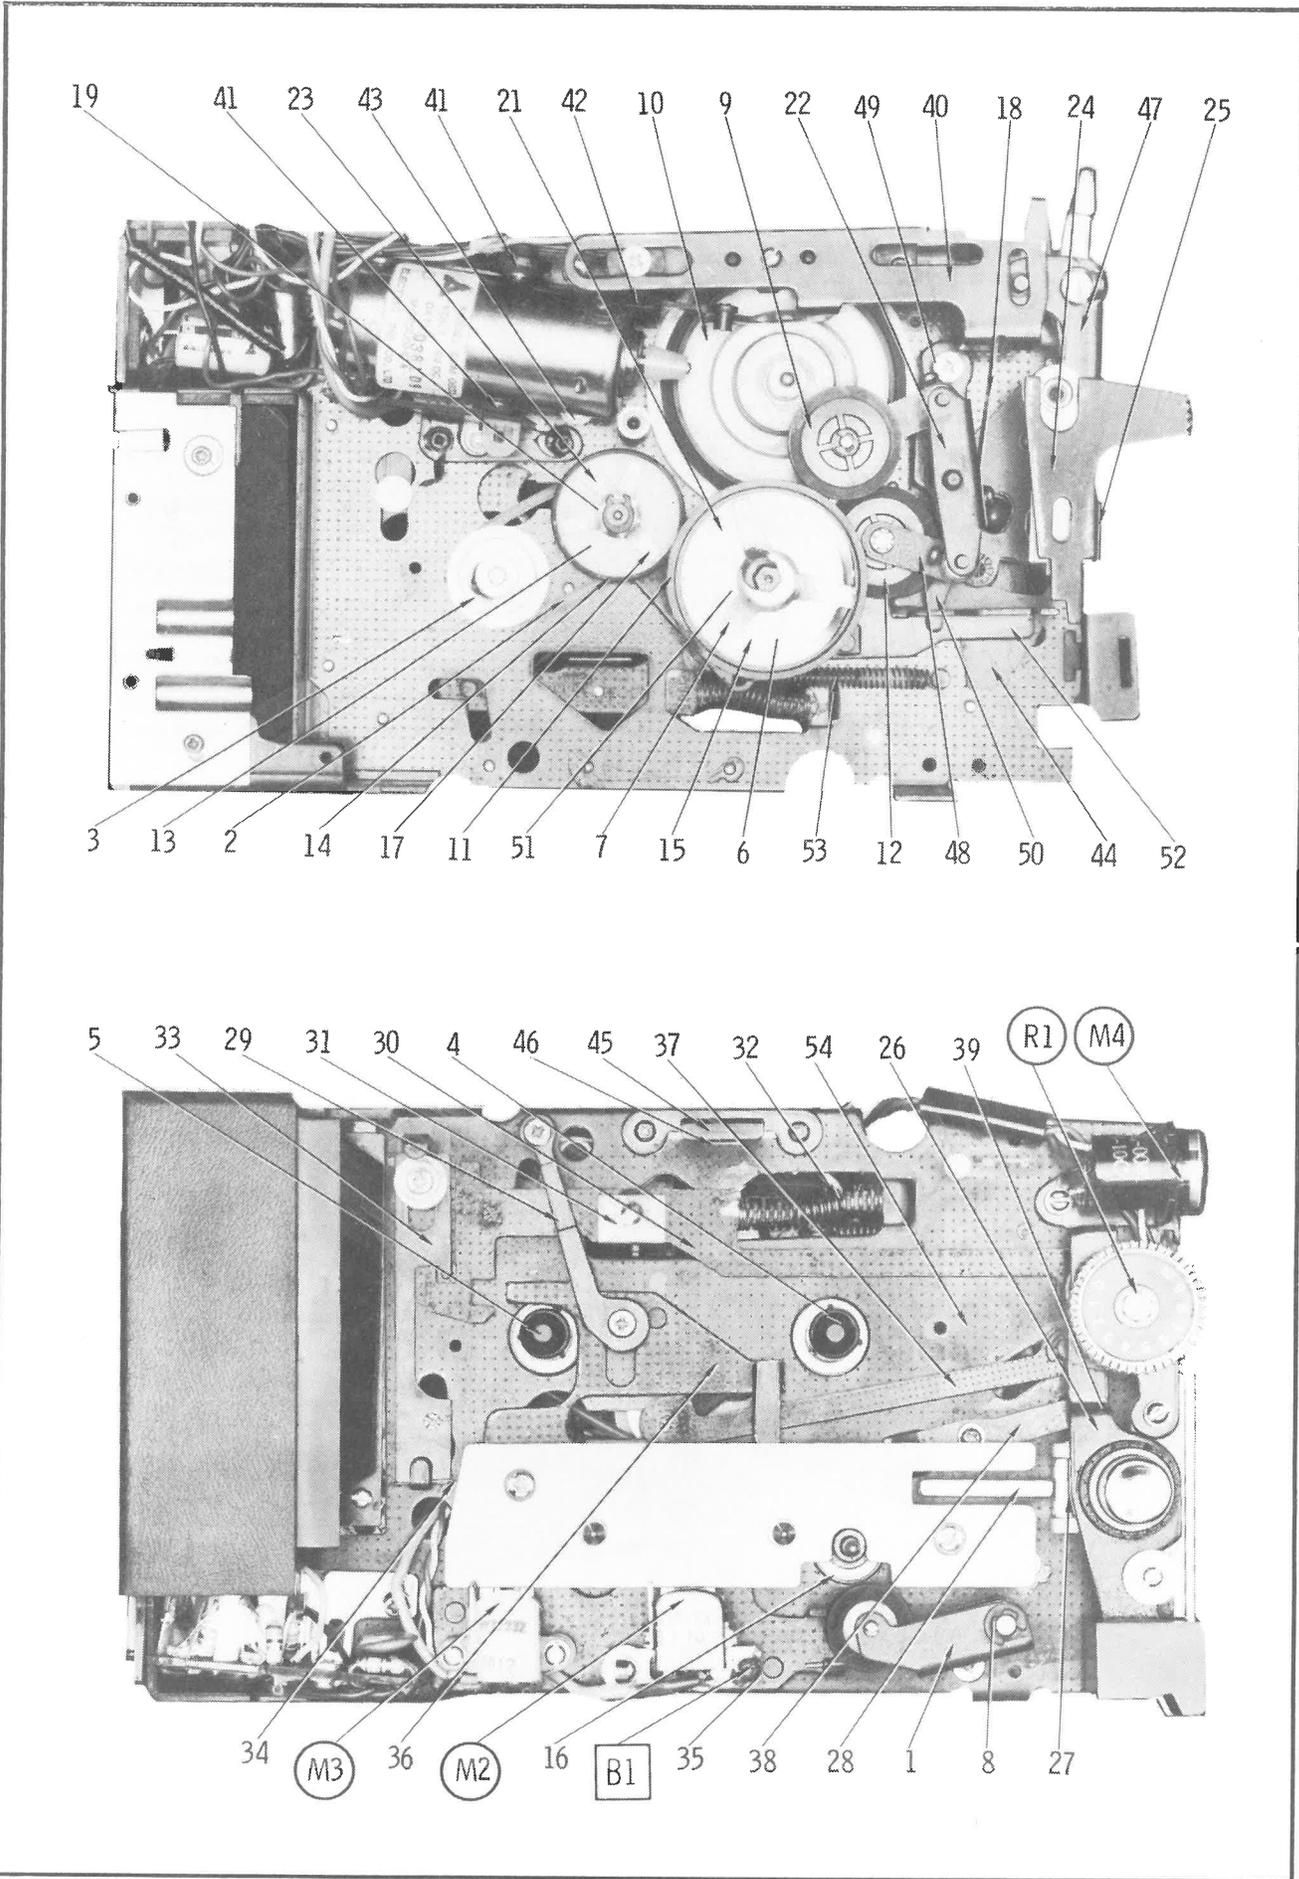

A power source of four, 1-1/2 volt "AA" cells is required.

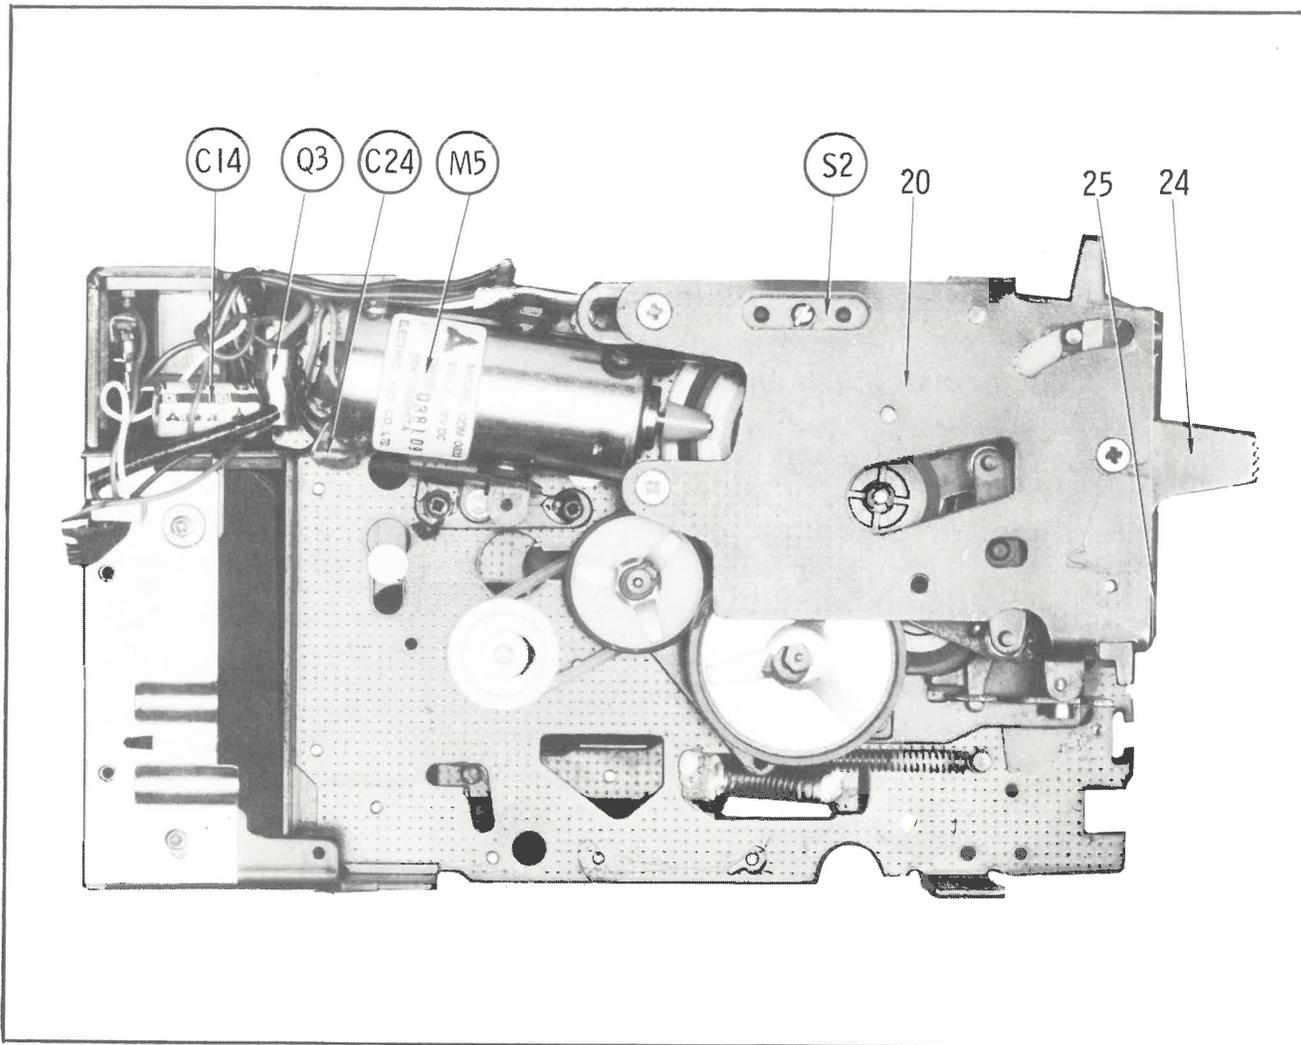

CONCORD MODEL F-101

CONCORD MODEL F-101

OPERATING INSTRUCTIONS

Record

Move Function Selector to Stop and insert a cassette, closed side first. Tabs on closed side must be intact.

Connect the microphone, move the switch on the microphone to On, and push and hold Record button while moving Function Selector to Play.

The unit will automatically maintain the correct recording level.

Play

Insert a cassette, move Function Selector to Play, and adjust the volume.

Monitor

To monitor the source while recording, connect an earphone to Earphone Output jack.

DISASSEMBLY

Remove three Phillips screws from each side of cabinet and two Phillips screws from battery compartment holding metal trim around cabinet, and remove trim by sliding trim off the battery end of the unit.

Remove bottom cover held by a Phillips screw.

Remove two, black Phillips screws from cassette well and remove top cover.

SEQUENCE OF OPERATION

Play

Pressing the Function Selector to Play pivots Lever (47), locked by Spring (38) and Ball (39), to move Actuator (40). Actuator (40) releases Lever (42) to allow Spring (43) to pivot Motor (M5), pressing the motor cam against Flywheel (10). Actuator (40) also actuates Switch (S2) and moves Spring (18). Spring (18) pivots Assembly (22) to press Idler (9) against Flywheel (10) and Pulley (11).

The motor -- through Flywheel (10), Idler (9), Pulley (11), Clutch (6), and Plate (15) -- drives Spindle (4).

Lever (47) also pulls Lever (37), pivoted by a slot in Plate (54), causing Lever (37) to slide Assembly (36). Assembly (36) moves the heads forward and allows Spring (8) to press Roller (1) against the capstan.

Record

The Record sequence is the same as "Play." However, the Record button is also depressed, if the cassette has moved Assembly (33), to pivot Lever (26) which pulls Lever (30) to move Spring (31) into the slot on Switch (S1). Lever (30) also locks onto Assembly (36). Assembly (36) slides forward (refer to "Play" sequence), pivoting Lever (30) to cause Spring (31) to actuate Switch (S1).

Fast Forward

After moving Lever (24) to Fast Forward to block

Lever (52), moving the Function Selector to Fast Wind pivots Lever (47), locked by Spring (38) and Ball (39), to move Actuator (40). Actuator (40) releases Lever (42) to allow Spring (43) to pivot Motor (M5), pressing the motor cam against Flywheel (10). Actuator (40) also actuates Switch (S2) and moves Spring (18). Spring (18) pivots Assembly (22) to move Lever (48), pressing Idler (12) against Flywheel (10) and Pulley (11).

The motor -- through Flywheel (10), Idler (12), Pulley (11), Clutch (6), and Plate (15) -- drives Spindle (4).

Rewind

After moving Lever (24) to Rewind to release Lever (52), moving the Function Selector to Fast Wind pivots Lever (47), locked by Spring (38) and Ball (39), to move Actuator (40). Actuator (40) releases Lever (42) to allow Spring (43) to pivot Motor (M5), pressing the motor cam against Flywheel (10). Actuator (40) also actuates Switch (S2).

Lever (47) also releases Plate (55) to release Lever (52), moved by Spring (53), to press Idler (14) against Flywheel (10).

The motor -- through Flywheel (10), Idler (14), Clutch (13), Pulley (19), Belt (2), and Pulley (3) -- drives Spindle (5).

Stop

Moving the Function Selector to Stop reverses the sequence for any previously selected function.

ADJUSTMENTS

IMPORTANT: Before making any adjustments, refer to "General Servicing Information" on page 4.

1. All voltage measurements referred to in this chart are made at a tape speed of 1-7/8 ips with an audio VTVM having a flat response to 100KC.
2. All torque measurements are made at a tape speed of 1-7/8 ips with a spring scale applied to a point 1 inch from spindle center.
3. All pressure measurements are made by using a spring scale to determine that point at which pressure is just removed.

ADJUST	REMARKS
Play Take-up Torque	Nominal value 1/2 oz. Controlled by condition of Idler (9) and Clutch (6).
Fast Forward Take-up Torque	Nominal value 3/4 oz. Controlled by condition of Idler (12) and Clutch (6).
Rewind Torque	Nominal value 3/4 oz. Controlled by condition of Idler (14), Belt (2), and Clutch (13).
Pressure Roller Pressure	Nominal value 10 oz. Controlled by tension of Spring (8).
Record/Play Head Azimuth	Connect an AC VTVM across speaker, play an azimuth-test tape, and adjust B1 for maximum output.
Erase Current	Nominal value 155 ma (11.2V rms) in erase head. No adjustment provided.
Record Bias	Nominal value 5.8V rms (1.55 ma) across record section of record/play head. No adjustment provided.

ADJUSTMENTS (Continued)

ADJUST	REMARKS
ARL Operation	Select record mode and disable bias oscillator by disconnecting wire at point $\diamond B$. Apply a 1,000-cycle tone at .0015V rms to mic input. Adjust volume control for .018V rms across the record section of the record/play head. The record/battery level indicator should indicate "normal maximum" recording level. Increasing the input level 10db should increase the voltage across the record section of the record/play head 6db.
Battery Level Indicator Calibration	Connect unit to a 4.3 VDC power supply and select play mode. Record/battery level indicator should indicate at the deviding line on the meter scale.
RF Trap Adjustment	Adjust L2 for MINIMUM RF at point $\diamond A$.
Motor Speed Adjustment	Play a speed-test cassette, follow instructions with cassette, and adjust R2 for proper response.

TROUBLE CHART

IMPORTANT: Before consulting this chart, refer to "General Servicing Information" on page 4.

SYMPTOM	REMARKS
Take-up erratic or inoperative in Play or Record.	Spindle (4) dirty, worn, or binding. Clutch (6) dirty or worn. Pulley (11) dirty or binding. Idler (9), dirty, worn, or binding.
Take-up erratic or inoperative in Fast Forward.	Spindle (4) dirty, worn, or binding. Clutch (6) dirty or worn. Idler (12) dirty, worn, or binding. Lever (48) broken or binding. Flywheel (10) binding.
Rewind erratic or inoperative.	Spindle (5) dirty, worn, or binding. Idler (14) dirty or binding. Clutch (13) dirty or worn. Belt (2) dirty, worn, or broken. Spring (53) broken or missing. Plate (44) binding.
Spindle does not stop immediately when stop function is selected.	Assembly (22) binding. Spring (18) bent.
Capstan does not rotate.	Flywheel (10) dirty or binding. Spring (43) bent or broken. Motor (M5) defective or not supplied with power.
Tape rides up and down between capstan and pressure roller.	Capstan bent. Roller (1) worn. Excessive take-up torque.
Wow or Flutter.	Roller (1) dirty or worn. Bearing (16) binding. Cassette defective. Motor defective. Excessive take-up torque.
Sound is weak or distorted.	Record/play head dirty, misadjusted, or defective. Amplifier defective. Bias oscillator defective. Cassette defective.
Erase weak or inoperative.	Erase head dirty or defective. Insufficient erase current.

NOTE: DEMAGNETIZE HEADS AFTER SERVICING RECORDER

CONCORD MODEL F-101

⚡ Denotes chassis ground.
 ⚡ Denotes measurement reference unless otherwise indicated.
 ⚡ Indicates measurement points.
 ⚡ Indicates connection not used in some versions.
 ⚡ See parts list.
 ⚡ All measurements taken in "Play" unless otherwise indicated.
 ⚡ Measured in "Record".
 ⚡ Values shown in μ are used in some applications.
 ⚡ Resistor values are 12% or less, 10% or 20% unless otherwise indicated.
 ⚡ Supply voltage maintained at rated value unless otherwise indicated.
 ⚡ Voltages are indicated unless otherwise indicated.
 ⚡ No signal applied and controls adjusted for normal operation.
 ⚡ Controls viewed from actuator end. Arrow indicates clockwise rotation.
 ⚡ Numbers assigned to terminals may not be found on the unit.
 ⚡ Transistor resistances vary widely. No resistance measurements taken.

	8429 (Two Conductor-Shielded)
	8419 (Three Conductor-Shielded)

GENERAL SERVICING INFORMATION

The following information applies to all recorders in this volume, and should be followed before any adjustments are made or trouble diagnosis is attempted. Any exceptions or additions will be found in the detailed servicing procedures for each recorder.

POWER SOURCES

Many recorders require full supply voltage for proper operation. Be sure the supply voltage is maintained at the rated value *under load* while making adjustments.

CLEANING

All head faces should be cleaned with head cleaner or methyl alcohol to remove dust and accumulated oxide. (An applicator may be fashioned from absorbent cotton.) Do not use a screwdriver or any metallic object near the head faces.

CAUTION: *Avoid getting head cleaner on any plastic surface.*

Clean the capstan, pressure roller, pressure pads and all tape guides with alcohol using a soft lint-free cloth. Also use alcohol to remove oil and grease from drive belts, idler wheels, brake drums and shoes, and all other driving surfaces.

LUBRICATING

Clean all surfaces before lubricating. Apply a few drops of #20 machine oil to all bearings and rotating bushings. Apply a thin film of light nonhardening grease to all sliding surfaces and detent rollers. Always wipe excess oil or grease from parts that have been lubricated.

CAUTION: *Oil and grease must be kept off all driving surfaces as well as any parts which may transfer oil or grease to them.*

DEMAGNETIZING

Record-Play heads require demagnetizing at regular intervals to maintain high-frequency response, dynamic range, and low distortion. (Follow instructions included with the demagnetizing unit.) After demagnetizing the heads, keep all screwdrivers and other metallic objects away from the head faces. Tape guides may also require occasional demagnetizing.

IMPORTANT: *Be sure to demagnetize the heads after making resistance measurements in the head circuits.*
